The future should have been perfect. Microscopic robots known as nans could repair any damage to your body, keep you young by resetting your cellular clocks, and allow you to download upgrades like intelligence, muscle strength, and eyesight. You were supposed to be able to have anything you wanted with a simple thought, to be able to fly without the aid of a machine, to be able to live forever. But when a small group of five terraformers working on Venus return to Earth, they discover that every other human in the solar system has been gruesomely murdered. Now, James Keats and his four companions must discover what happened to the rest of humanity and fight back if they wish to avoid the same, horrifying fate. Welcome to the post-human era.

The author's lifetime of insight as the leading authority on slavery in the Western world is summed up in this compelling narrative that links together the profits of slavery, the pain of the enslaved, and the legacy of racism in a sweeping and compelling history of the institution of slavery in the United States. By the Pulitzer Prize-winning author of The Problem of Slavery in Western Culture.

'A must read … a new analytical agenda for the Anthropocene, coherently drawing out the power of thinking with islands.' – Elena Burgos Martinez, Leiden University 'This is an essential book. [The] analytics they propose … offer both a critical agenda for island studies and compass points through which to navigate the haunting past, troubling present, and precarious future.' – Craig Santos Perez, University of Hawai'i, Manoa 'All academic books should be like this: hard to put down. Informative, careful, sometimes devasting, yet absolutely necessary - if you read one book about the Anthropocene let it be this. You will never think of islands in the same way again.' – Kimberley Peters, University of Oldenburg ' … a unique journey into the Anthropocene. Critical, generous and compelling'. — Nigel Clark, Lancaster University The island has become a key figure of the Anthropocene – an epoch in which human entanglements with nature come increasingly to the fore. For a long time, islands were romanticised or marginalised, seen as lacking modernity's capacities for progress, vulnerable to the effects of catastrophic climate change and the afterlives of empire and coloniality. Today, however, the island is increasingly important for both policy-oriented and critical imaginaries that seek, more positively, to draw upon the island's liminal and disruptive capacities, especially the relational entanglements and sensitivities its peoples and modes of life are said to exhibit. Anthropocene Islands: Entangled Worlds explores the significant and widespread shift to working with islands for the generation of new or alternative approaches to knowledge, critique and policy practices. It explains how contemporary Anthropocene thinking takes a particular interest in islands as 'entangled worlds', which break down the human/nature divide of modernity and enable the generation of new or alternative approaches to ways of being (ontology) and knowing (epistemology). The book draws out core analytics which have risen to prominence (Resilience, Patchworks, Correlation and Storiation) as contemporary policy makers, scholars, critical theorists, artists, poets and activists work with islands to move beyond the constraints of modern approaches. In doing so, it argues that engaging with islands has become increasingly important for the generation of some of the core frameworks of contemporary thinking and concludes with a new critical agenda for the Anthropocene.

This textbook introduces advanced students of International Relations (and beyond) to the ways in which the advent of, and reflections on, the Anthropocene impact on the study of global politics and the disciplinary foundations of IR. The book contains 24 chapters, authored by senior academics as well as early career scholars, and is divided into four parts, detailing, respectively, why the Anthropocene is of importance to IR, challenges to traditional approaches to security, the question of governance and agency in the Anthropocene, and new methods and approaches, going beyond the human/nature divide.

John Mars is the oldest astronaut in the fleet and the commander of Challenger II. His latest assignment from NASA is a top-secret shuttle mission to the moon to investigate a mysterious signal. What he finds is an alien robot that murders his crew and destroys the source of that signal-a deep-space probe. When John returns to Earth without his crew, the probe, or any evidence of what really happened on his mission, NASA forces him into retirement. Humiliated and disgraced, John takes a job as a pilot for a commercial airline, unaware that his experience on the moon has marked him more than psychologically: in the battle to save his crew and himself, John Mars was injected with an alien tracking device. One night, while flying his regular route, John and the occupants of hisplane, including his fiance Anna, are whisked aboard a gigantic ship and thrown into deep space toward the Andromeda Galaxy-home to an Alien species called "Sels." The Sels live for one thing only, colonization of all worlds in the known universe. And now they've got their sights set on Earth. But in order to decide if Earth is a worthy adversary, the Sels have something special planned for John-a kind of alien vetting program. John, Anna and the rest of his group arrive on a Sel planet used for wargames, where alien life forms are pitted against one another-and the Sels-in death battles. One by one, John Mars' small group of survivors succumb to the Sels. But a larger problem looms for Mars-even if he can survive the Sel wargames, how could he ever get back home and warn Earth of impending invasion and assimilation into the Sel Empire?"

A young man describes his torment as he struggles to reconcile the diverse influences of Western culture and the traditions of his own Japanese heritage

WINNER of the 2018 Campbell Award for Best Novel A WALL STREET JOURNAL Best Science Fiction Book of 2017 In this science fiction thriller, brothers are pitted against each other as a pandemic threatens to destabilize world governments by exerting a subtle mind control over survivors. Neil Johns has just started his dream job as a code breaker in the NSA when his brother, Paul, a mycologist, goes missing on a trip to collect samples in the Amazon jungle. Paul returns with a gap in his memory and a fungal infection that almost kills him. But once he recuperates, he has enhanced communication, memory, and pattern recognition. Meanwhile, something is happening in South America; others, like Paul, have also fallen ill and recovered with abilities they didn't have before. But that's not the only pattern--the survivors, from entire remote Brazilian tribes to American tourists, all seem to be working toward a common, and deadly, goal. Neil soon uncovers a secret and unexplained alliance between governments that have traditionally been enemies. Meanwhile Paul becomes increasingly secretive and erratic. Paul sees the fungus as the next stage of human evolution, while Neil is convinced that it is driving its human hosts to destruction. Brother must oppose brother on an increasingly fraught international stage, with the stakes: the free will of every human on earth. Can humanity use this force for good, or are we becoming the pawns of an utterly alien intelligence?

Inhuman is Book 5 in the best-selling, smash hit phenomenon, Post-Human series. In this nearly 400 pages, 109k word epic story. Readers will get to rejoin all of the characters they fell in love with along the way in the previous 4 books. Inhuman not only ties the first four books together, it also introduces a new villain, one that has been lurking in the background throughout, and that will trump any villain in the history of literature, film, or comics. V-SINN is its name, and, this time, it may just be too much for the post-humans to handle. Inhuman is to the Post-Human series as The Empire Strikes Back was to Star Wars--the middle act when revelations emerge, old sins come back to haunt, and the journey of the heroes that readers have fallen in love with deepens, darkens, and entertains to a whole new level. Post-Human fans will not be disappointed with this epic middle act! Enjoy!

The Trojan War rages at the foot of Olympos Mons on Mars -- observed and influenced from on high by Zeus and his immortal family -- and twenty-first-century professor Thomas Hockenberry is there to play a role in the insidious private wars of vengeful gods and goddesses. On Earth, a small band of the few remaining humans pursues a lost past and devastating truth -- as four sentient machines depart from Jovian space to investigate, perhaps terminate, the potentially catastrophic emissions emanating from a mountaintop miles above the terraformed surface of the Red Planet.

We imagine posthumans as humans made superhumanly intelligent or resilient by future advances in nanotechnology, biotechnology, information technology and cognitive science. Many argue that these enhanced people might live better lives; others fear that tinkering with our nature will undermine our sense of our own humanity. Whoever is right, it is assumed that our technological successor will be an upgraded or degraded version of us: Human 2.0. Posthuman Life argues that the enhancement debate projects a human face onto an empty screen. We do not know what will happen and, not being posthuman, cannot anticipate how posthumans will assess the world. If a posthuman future will not necessarily be informed by our kind of subjectivity or morality the limits of our current knowledge must inform any ethical or political assessment of that future. Posthuman Life develops a critical metaphysics of posthuman succession and argues that only a truly speculative posthumanism can support an ethics that meets the challenge of the transformative potential of technology.
